POLICY COMMITMENT TO EMISSIONS REDUCTION

Commitment to the reduction of greenhouse gas emissions

Ancona International Airport S.p.A. recognises climate change as one of the main environmental challenges and considers the management and progressive reduction of greenhouse gas emissions an integral part of its sustainability journey.

This commitment builds on the path already undertaken by the Company, which in its Service Charter states its objective of contributing to a culture of environmental respect and sustainable development, with the ambition of moving towards a "Green Airport" model.

In this context, Ancona International Airport S.p.A. is committed to measuring and monitoring over time the emissions associated with its activities, with particular attention to sources under its direct control and to energy consumption, progressively identifying reduction opportunities through energy efficiency measures, optimisation of consumption and the adoption of lower-emission solutions.

This approach is already reflected in a number of measures implemented at the airport, including the upgrade of lighting systems in the aircraft apron, terminals and car parks with low-consumption LED technology, as well as the introduction of energy-efficient technological solutions, the covering of the terminals with a photovoltaic system in 2026 and the construction of a solar farm with a battery storage system in 2027, ultimately covering over 80% of energy consumption.

The Company also intends to progressively integrate emissions management into its decision-making processes, raise awareness among employees and encourage the involvement of airport operators and other stakeholders in identifying shared solutions to reduce climate impact.

Management supports this commitment and promotes a process of continuous improvement in environmental performance through emissions monitoring, the definition of reduction actions and the periodic assessment of the results achieved.
